FOREWORD

This is the report of a study relating to our public schools which might well be classified as evaluative. Appraisal of the school program in terms of what becomes of our graduates is an approach toward total evaluation which we in North Carolina have not emphasized sufficiently. Evaluation in terms of individual growth and development, in terms of the reasons underlying the large number of student drop-outs, and in terms of what becomes of our high school graduates will always afford us compelling motivation for improving our total school effort.

The low per capita income in North Carolina is a matter of grave concern to everyone who is familiar with the economy of the State; and the relationship between per capita income and the educational level of the people cannot be ignored or easily overlooked. Statistics show that the State ranks low in the percentage of the adult population (25 years and above) with thirteen or more years of school; it ranks low also in the percentage of civilian workers in professional and technical positions. Nevertheless, we must assume, it seems, that the native intelligence of North Carolina's children is comparable to that of the children of any state.

The fact that North Carolina is reported as ranking next to the lowest among the states in the percentage of college-age youth in college presents another challenging situation. Though not a wealthy State, this study indicates that lack of finances seems not to be the major factor in our unenviable record in this respect. Location of colleges and distances involved, though a significant factor, seems not to be a deterrent in many communities. It appears that the presence, or lack, of incentive in the local communities of the State determines, in large measure, the number of high school graduates who enter college. If it is agreed that motivation for entering college is adult-inspired, by and large, then it seems urgent that parents, teachers, and other adults consolidate their influence in seeing to it that more North Carolina youth with ability are qualified and have the opportunities for continuing their development in college. Adequate leadership in North Carolina makes it imperative that the problems so vividly pointed out in this study be cooperatively tackled by all of us interested in the future of our State.

92959

May I take this opportunity to express deep gratitude to the many superintendents and high school principals who furnished the data for this study, and to Nile F. Hunt, Coordinator of Teacher Education, who compiled and analyzed the information. The study reveals some significant facts relative to the current utilization of our human resources; and should suggest, it seems, the urgency for further study and action within the immediate future.

Chas. F. Carroll

State Superintendent of Public Instruction

April 1, 1955.

What Becomes of Our High School Graduates

A survey including about seventy per cent of the approximate 36,000 high school graduates of 1954 reveals that one-third of the white graduates and one-fourth of the Negro graduates, or 31 per cent for the State as a whole, entered college. In addition, eight per cent continued formal education in trade schools, business schools, and nurses' training programs. Military service claimed seven per cent of the graduating seniors.

COLLEGE ATTENDANCE

There is a wide variation among administrative units of the State in the number of graduates going to college. For some units, the percentage ranges well into the seventies, whereas in others it is as low as ten per cent. On a county basis, consolidating data from county and city units where applicable, the range is likewise significant. Twelve counties sent fewer than twenty per cent of their graduates to college and seven sent forty per cent or more.

The data reveal some difference between the white and Negro students and a rather significant difference between rural and urban students. Approximately one out of three white high school graduates enrolled in college, whereas the ratio was one out of four among the Negro graduates. Forty-four per cent of the white students graduating from high schools in city administrative units entered college, as compared to 25 per cent from high schools in county administrative units. The differential in this regard is much less for Negroes, amounting to only seven percentage points.

These figures seem to indicate that not nearly all the well-qualified high school graduates are taking advantage of opportunities for higher education. Further evidence of this is noted in the fact that only two out of three graduates who finished first and second scholastically in their respective classes—the students sometimes designated valedictorian and salutatorian—are currently enrolled in college.

Any evidence which indicates or which may be construed to imply faulty utilization of the State's human resources naturally gives rise to some pertinent questions. In the matter of college

attendance by high school graduates, it is difficult to isolate reasons why a certain school or administrative unit sends one out of two graduates into higher education while another sends only one out of ten.

LOCATION OF COLLEGES AS A FACTOR IN COLLEGE ATTENDANCE

It would be reasonable to assume that the location of a college is a significant factor in college attendance; and the data support such an assumption to a degree. The counties enrolling ten per cent or more of their white high school graduates in junior colleges either have junior colleges within their boundaries or in their immediate proximity. The evidence is not so convincing, however, relative to the four-year colleges; in fact, many counties and cities not advantageously located as to distance have proportionately more of their graduates entering college.

FINANCIAL RESOURCES AS A FACTOR IN COLLEGE ATTENDANCE

Questions relating to economic circumstances likewise arise early in any deliberations concerning education at the college level. Financial ability, undoubtedly, is a determining factor in the percentage of high school graduates a community sends to college. The absence of a reliable measure of financial ability forbids accurate analysis in this respect; nevertheless, there are some definite and noteworthy interrelationships in the data at hand. Of the ten counties which rank lowest in percentage of high school graduates going to college, seven are in the lowest quartile as to estimated per capita income.* Similarly, of the ten counties which rank highest in percentage of graduates entering college, five are in the highest quartile as to estimated per capita income. On the other hand, there is a number of counties ranking low in estimated per capita income but having a high percentage or graduates entering college.

SCHOLARSHIP AID

Consideration of economic factors affecting the number of high school graduates entering college brings the matter of scholarship aid to attention. It is of interest to note that more than

*Income data considered are presented in *The Estimation of Income Payments to Individuals in North Carolina Counties* by Lowell D. Ashby and Everett P. Truex. School of Business Administration, University of North Carolina, Chapel Hill. 1952, pp. 34-5.

half the graduates attending college from certain cities and counties are receiving some kind of scholarship aid, yet in other administrative units fewer than five per cent are receiving aid. Of all the high school graduates shown by the survey to be in college, 19 per cent are receiving scholarship aid—18 per cent white and 29 per cent Negro.

The differences between city and county administrative units are slight but significant. As stated earlier, proportionately more students, white and Negro, enter college from city units than from county units. Sixteen per cent of the students from white schools in city units are receiving assistance, whereas 20 per cent of the students from county units are sharing in the available aid. For white students, the average for all units is 18 per cent. Among the Negro students entering college, 30 per cent from city units and 28 per cent from county units, or, 29 per cent of the total, are benefitting from some type of financial aid.

Specific reasons for the difference cited above are not readily apparent. Scholastic ability and economic resources of potential enrollees undoubtedly enter the picture. On the other hand, stronger and sometimes less obvious factors affecting entrance into college center around school and community relationships with colleges and the aspirations of youth—shared, encouraged, and implemented by parents and teachers. Wise use of available scholarship aid and efforts to increase such aid are twin objectives that might well claim the attention of parents, educators, and citizens generally throughout the State.

MOTIVATION AS A FACTOR IN COLLEGE ATTENDANCE

The location of colleges and the economic circumstances surrounding individuals and communities have definite but limited bearing upon the per cent of high school graduates who continue their education in college. A perspective which clearly outlines the determining factors is difficult, if not impossible, to obtain; since an attitudinal element is unquestionably involved—an element of great significance, but one not to be measured objectively. The complete answer as to why more young people go to college from one community than from another must include, it seems, the factor of stimulation or motivation which parents and teachers impart to the students. Such motivation may be in keeping with community tradition or merely an indication of the current value placed upon higher education. In each instance, it appears safe to assume that the local community is largely responsible for the motivating forces which stimulate pupils to enter college.

HIGH SCHOOL GRADUATES TERMINATING FORMAL EDUCATION

In determining the number of graduates who continue formal education beyond high school, the survey also shows that more than half, 53 per cent, of the graduates are entering *directly* into the on-going life of their communities. Forty-seven per cent of the boys and 58 per cent of the girls are in this category. Undoubtedly, marriage and consequent homemaking duties constitute a real factor in accounting for many girls who do not continue their formal education; and it appears logical to assume that a large number of boys find their places in agriculture, in business, and in industry as semi-skilled and unskilled workers. The important fact, however, and the one which should claim the attention of educators and lay-citizens alike, is the degree to which the public school is successful in helping to equip these young people to live advantageously.

THE PROBLEM REDEFINED

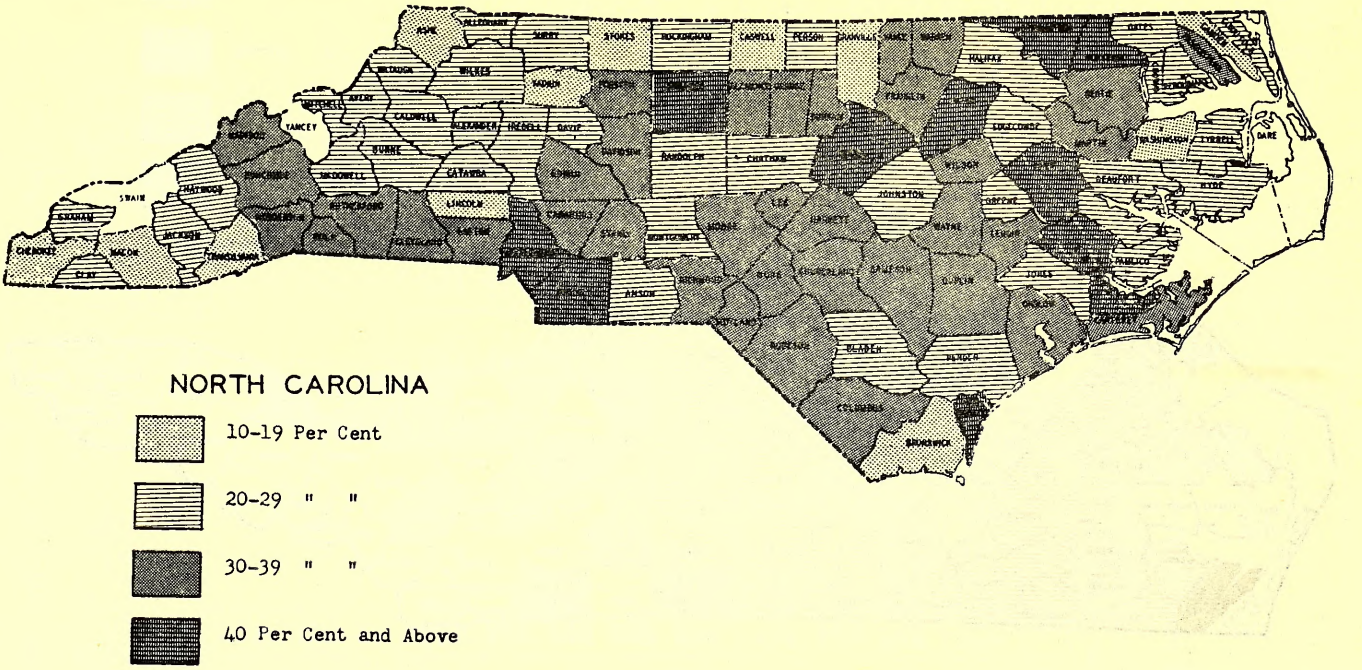
The continued progress of North Carolina as a State and the well-being of her people are dependent, in large measure, on the leadership within the State. The quantitative and qualitative measure of that leadership is determined by the extent to which communities throughout the State consistently prepare their most capable young people for positions of responsibility. This study is presented as an aid in evaluating accomplishments in this direction.

ERRATA

Figure 1, Page 9—Watauga County should be shaded to indicate 30-39 per cent; Scotland County should be shaded to indicate 40 per cent and above.

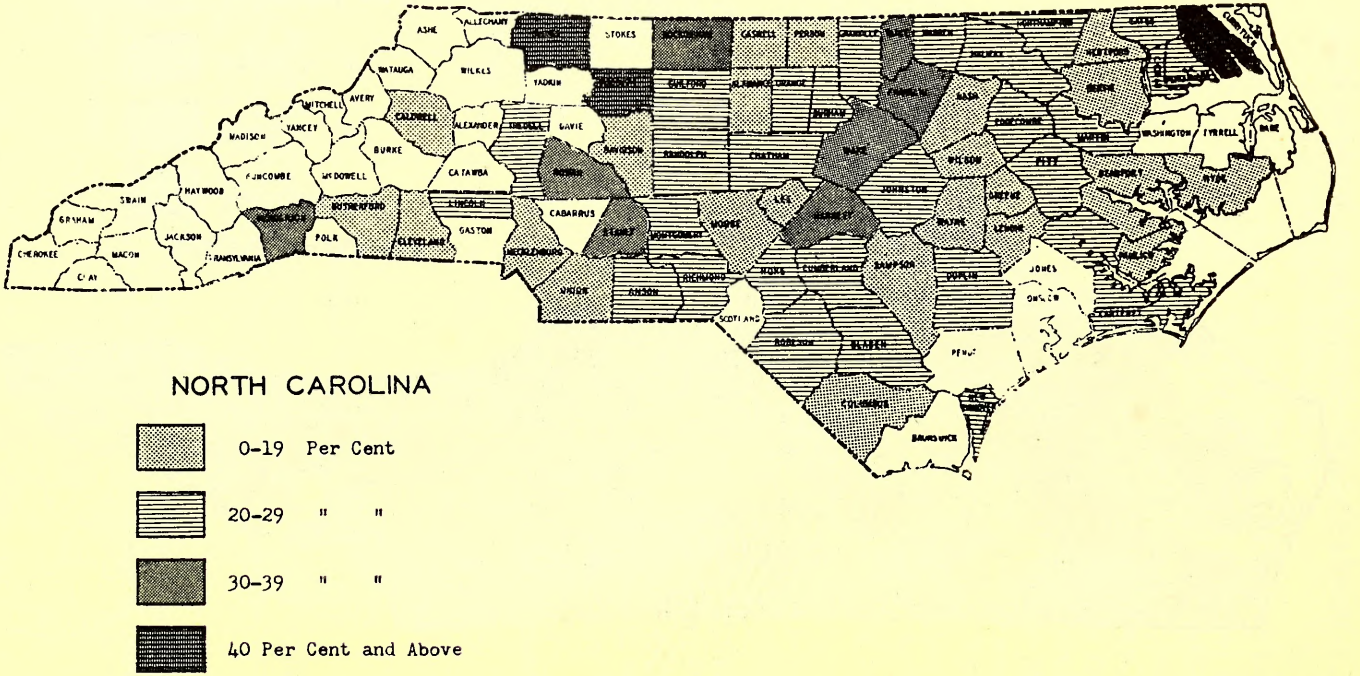
Figure 2, Page 10—Yadkin County should be shaded to indicate 0-19 per cent; Currituck County should be shaded to indicate 20-29 per cent.

Figure 1. PERCENTAGE OF 1954 HIGH SCHOOL GRADUATES ENTERING COLLEGE BY COUNTIES (WHITE)



No data were received from the three unshaded counties.

Figure 2. PERCENTAGE OF 1954 HIGH SCHOOL GRADUATES ENTERING COLLEGE BY COUNTIES (NEGRO)



Unshaded counties include those in which there were no graduates and those from which data have not yet been received.

TABLE I. STATE SUMMARY OF FOLLOW-UP SURVEY OF 1954 HIGH SCHOOL SENIORS IN NORTH CAROLINA

		Boys		Girls		Total	
		No.	Per cent	No.	Per cent	No.	Per cent
